Part 2

Create a file `simple-pod.yaml`

```yaml
apiVersion: v1
kind: Pod
metadata:
  name: nginx
spec:
  containers:
  - name: nginx
    image: nginx:1.14.2-alpine
    ports:
    - containerPort: 80
```

To create the Pod shown above, run the following command:

`kubectl apply -f simple-pod.yaml`

Check pod

`kubectl get pods`

Kill the Pod.

`kubectl delete pod nginx`

Pods are generally not created directly and are created using workload resources.

See Working with Podshttps://kubernetes.io/docs/concepts/workloads/pods/#working-with-pods for more information on how Pods are used with workload resources
